Scumflower

Scumflower is made of a microfibre material specially treated to retain fat molecules present on the surface of the water. The fibres have both lipophilic and hydrophobic properties. The former is a substance which attracts and retains oily substances, and the latter is a substance which repels water. Thanks to these characteristics, Scumflower absorbs the oily substances released from animal's coats and atmospheric pollution while remaining afloat as it is not able to absorb water. In other words, Scumflower is an "intelligent" absorber.

Suggested use:

- Place Scumflower on the surface of the water in the basket skimmer.
- Disposable – Scumflower should be changed every 3 to 5 weeks according to how often the pool is used.

Each type of pollution causes Scumflower to turn a different colour. It turns brown to black from air pollution and ivory to beige from pollen and vegetation. It may not become too discoloured when absorbing lotions and creams as neither product has a colour to begin with. This doesn't mean your Scumflower is not working or that you shouldn't change it as suggested.

Available in boxes of 6 or singularly.
